5       The present invention relates to the treatment of certain conditions using a compound of formula I or II, or a pharmaceutically acceptable salt thereof, as defined below. Specifically, the compounds of formulas I and II, and their pharmaceutically acceptable salts, as defined below, exhibit corticotropin-releasing factor (CRF) antagonist activity and are useful in the treatment of cardiovascular or heart related diseases such as hypertension, tachycardia, and congestive heart failure, stroke, osteoporosis, premature birth, psychosocial dwarfism, stress-induced fever, ulcer,  
10       diarrhea, post-operative ileus, and colonic hypersensitivity associated with psychopathological disturbance and stress.

The compounds of formulas I and II, their pharmaceutically acceptable salts, and methods of preparing such compounds and salts are referred to in copending PCT international patent application numbers PCT/IB95/00373 (filed May 18, 1995) and PCT/IB95/00439 (filed June 6, 1995), both of which designate the United States, and in copending United States patent applications serial numbers 08/448,539 (filed June 14, 1995) and 08/481,413 (filed June 15, 1995). PCT international patent application numbers POT/IB95/00373 and PCT/IB95/00439, and United States patent application numbers 08/448,539 and 08/481,413, referred to above, are incorporated herein by reference in their entirety.

The foregoing PCT international patent applications and United States patent applications refer to the use of the compounds of formulas I and II in the treatment of illnesses induced or facilitated by corticotropin releasing factor and in the treatment of anxiety, depression, fatigue syndrome, gastrointestinal diseases, headache, pain, cancer, immune dysfunction, hemorrhagic stress, drug addiction, drug and alcohol withdrawal symptoms, fertility problems, stress-induced psychotic episodes, neurodegenerative diseases such as Alzheimer's disease; irritable bowel syndrome including Crohn's disease, spastic colon and irritable colon; eating disorders such as anorexia nervosa; and inflammatory disorders such as arthritis, asthma and allergies.

25 Other CRF antagonists that can be used to treat the disorders recited in the method of this invention are referred to in copending PCT international patent application number PCT/B95/00318 (filed May 4, 1995), which designates the United States, and in copending United States patent applications serial numbers 08/448,534 (filed June 14, 1995) and 08/448,529 (filed June 14, 1995). PCT international patent application number PCT/B95/00318, and United States patent application numbers 08/448,534 and 08/448,529, referred to above, are incorporated herein by reference in their entirety.

CRF antagonists are mentioned in U.S. Patents 4,605,642 and 5,063,245 referring to peptides and pyrazolinones, respectively. The importance of CRF antagonists is set out in the literature, e.g., as discussed in U.S. Patent 5,063,245, which is incorporated herein by reference. A recent outline of the different activities possessed by CRF antagonists is found in M. J. Owens et al., *Pharm. Rev.*, Vol. 43, pages 425 to 473 (1991), also incorporated herein by reference.

The method of the invention further comprises the treatment of stroke by administering to a mammal, including a human, in need of such treatment a therapeutically effective amount of a compound of formula II, referred to above, or a pharmaceutically acceptable salt thereof, wherein a double bond connects E and D, D is  $-CR_{10}$  or N, E is  $-CR_4$ , and Y and A are N. Compounds of formula III, provided below, are the compounds of formula II wherein a double bond connects E and D, D is  $-CR_{10}$  or N, E is  $-CR_4$ , and Y and A are N. The compounds of formula III are provided below in the claims and are directed to the treatment of stroke.

Whenever reference is made herein to 3- to 8-membered cycloalkyl or 9- to 12-membered bicycloalkyl optionally containing one or two of O, S, or -N-G, it is understood that the oxygen and sulfur atoms are not adjacent to each other in the cycloalkyl or bicycloalkyl ring system. The three membered cycloalkyl optionally contains just one of O, S, or -N-G. An example of a six-membered cycloalkyl having O and NH is morpholinyl.

Whenever  $R_2$  or  $R_5$  is a heterocyclic group, the attachment of the group is through a carbon atom.

In the compounds of formulas I and II, referred to above, certain aminal or acetal moieties may not be sufficiently stable for use in the method of the invention. Such unstable compounds may include, for example, a compound of formula I or II wherein B is  $-NR_1R_2$  and  $R_1$  is  $-CH(OH)CH_3$ . Such unstable compounds will be apparent to those skilled in the art and do not form part of the invention.

Formulas I and II, referred to above, are intended to include all stereoisomers (e.g., all geometric and optical isomers) as well as racemates of all individual compounds within the depicted genus.

#### Detailed Description of the Invention

The compounds of formulas I and II, and their pharmaceutically acceptable salts, are readily prepared. The compounds of formula II wherein A, D and Y are N, a double bond connects E and D, and E is  $-CR_4$ , are prepared by one or more of the synthetic methods referred to in United States patent application serial number 08/481,13, referred to above. The compounds of formula II wherein A and Y are N, a double bond connects E and D, E is  $-CR_4$ , and D is  $-CR_{10}$ , are prepared by one or more of the synthetic methods referred to in United States patent application serial number 08/448,539, referred to above. The compounds of formula II wherein A is  $-CR_7$ , a double bond connects E and D, E is  $-CR_4$ , D is N or  $-CR_{10}$ , and Y is N, are prepared by one or more of the synthetic methods referred to in PCT international application number PCT/IB95/00373, referred to above. The remaining compounds of formula II and

the compounds of formula I are prepared by one or more of the synthetic methods referred to in PCT international application number PCT/IB95/00439, referred to above.

Pharmaceutically acceptable salts of the compounds of formulas I and II include salts of acidic or basic groups. For example, pharmaceutically acceptable salts include sodium, calcium and potassium salts of acidic groups, such as when the  $R_{10}$  substituent is carboxy. Such salts are generally prepared by combining a compound of formula I or II with one molar equivalent of NaOH or KOH in a suitable solvent. Pharmaceutically acceptable acid addition salts of basic groups, such as amino groups, are formed by reacting the base form of a compound of formula I or II with an appropriate acid. Pharmaceutically acceptable salts of basic groups include hydrochloride, hydrobromide, sulfate, hydrogen sulfate, phosphate, hydrogen phosphate, dihydrogen phosphate, acetate, succinate, citrate, tartrate, lactate, mandelate, methanesulfonate (mesylate) and p-toluenesulfonate (tosylate) salts. When the salt is of a monobasic acid (e.g., the hydrochloride, the hydrobromide, the p-toluenesulfonate, the acetate), at least one molar equivalent and usually a molar excess of the acid is employed. However, when such salts as the sulfate, the hemisuccinate, the hydrogen phosphate or the phosphate are desired, the appropriate and exact chemical equivalents of acid will generally be used. The free base and the acid are usually combined in a co-solvent from which the desired salt precipitates, or can be otherwise isolated by concentration or addition of a non-solvent.

In the method of the invention, the compounds of formulas I and II, and their pharmaceutically acceptable salts, can be administered alone or in combination with pharmaceutically acceptable carriers, in either single or multiple doses. Suitable pharmaceutical carriers include inert solid diluents or fillers, sterile aqueous solution and various organic solvents. The pharmaceutical compositions formed by combining the active compounds and the pharmaceutically acceptable carriers are then readily administered in a variety of dosage forms such as tablets, powders, lozenges, syrups, injectable solutions and the like. These pharmaceutical compositions can, if desired, contain additional ingredients such as flavorings, binders, excipients and the like. Thus, for purposes of oral administration, tablets containing various excipients such as sodium citrate, calcium carbonate and calcium phosphate may be employed along with various disintegrants such as starch, alginic acid and certain complex silicates, together with binding agents such as polyvinylpyrrolidone, sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often useful for tableting purposes. Solid compositions of a similar type can also be employed as fillers in soft and hard filled gelatin capsules. Preferred materials for this include lactose or milk sugar and high molecular weight polyethylene glycols. When aqueous suspensions or elixirs are desired for oral administration, the essential active ingredient therein may be combined with various sweetening or flavoring agents, coloring matter or dyes and, if desired, emulsifying or suspending agents, together with diluents such as water, ethanol, propylene glycol, glycerin and combinations thereof. Oral administration is generally preferred. However, if the patient is unable to swallow, or oral absorption is otherwise impaired, another route of administration such as suppositories, parenteral (i.m., i.v.), or topical administration will be appropriate.

For parenteral administration, solutions of the active compound in sesame or peanut oil, aqueous propylene glycol, or in sterile aqueous solution can be employed. Such aqueous solutions should be suitably buffered if necessary and the liquid diluent first rendered isotonic with sufficient saline or glucose. These particular aqueous solutions are especially suitable for intravenous, intramuscular, subcutaneous and intraperitoneal administration. The sterile aqueous media employed are all readily available by standard techniques known to those skilled in the art.

In the method of the invention, the effective dosage for the compounds of formulas I and II, and their pharmaceutically acceptable salts, depends on the intended route of administration and other factors such as age and weight of the patient, as generally known to a physician. The dosage also depends on the illness to be treated. In general, the daily dosage will generally range from about 0.1 to 50 mg/kg of the body weight of the patient to be treated. The daily dosage may be given in a single dose or up to three divided doses. In the prevention of premature birth, the dosage should be administered daily after high levels of corticotropin-releasing hormone have been detected early in pregnancy and then discontinued just prior to the end of the term for normal pregnancy.

The methods for testing the compounds of formulas I and II, and their pharmaceutically acceptable salts, for CRF antagonist activity are as described in Endocrinology, 116, 1653-1659 (1985) and Peptides 10, 179-188 (1989) which determine the binding affinity of a test compound for a CRF receptor. The binding affinities for the active compounds, expressed as  $IC_{50}$  values, generally range from about 0.2 nanomolar to about 10 micromolar.

**INCOMPLETE SEARCH**

The Search Division considers that the present European patent application does not comply with the provisions of the European Patent Convention to such an extent that it is not possible to carry out a meaningful search into state of the art on the basis of some of the claims.

Claims searched completely:

Claims searched incompletely: 1-16

Claims not searched:

Reason for the limitation of the search: The use of the compounds defined in the present claims for the treatment of the medical indication given in claims 1 and 16 appears to solely be hypothetical. The applicant has not given any evidence that firstly the given indications have anything to do with CRF, nor that they can be treated with any CRF antagonist. The search has therefore been limited to the general inventive concept, i.e. the use of the defined compounds as CRF antagonists.
